FEBS Lett. 378:126-130(1996).
-!- FUNCTION: In addition to gelatin and collagens, it cleaves KiSS1
at a Gly-|-Leu bond.
-!- CARALYTIC ACTIVITY: Cleaves of gelatin type I and collagen types
IV, V, VII, X. Cleaves the collagen-like sequence Pro-Gln-Gly-|-
Ile-Ala-Gly-Gln.

                                                                                                                                                                                                                                                       Activation peptide.
72 kDa type IV collagenase.
Pibronectin type-II 1.
Pibronectin type-II 2.
Pibronectin type-II 3.
Hemopexin-like.
SIMILARITY: Belongs to the peptidase M10A family. SIMILARITY: Contains 3 fibronectin type-II domains. SIMILARITY: Contains 1 hemopexin-like domain.
                                                                                                                                                                                                                                                                                              Collagenase-like 1.
Collagen-binding.
Collagenase-like 2.

RA Okada A., Basset P.;

The cloning of the cDNA encoding rat gelatinase A from a rat skin wound cDNA library.";

Submitted (JUL-1996) to the EMBL/GenBank/DDBJ databases.

LIB-ALA-TIC ACTIVITY: Cleavage of gelatin type I and collagen types

IL -- CATALYTIC ACTIVITY: Cleavage of gelatin type I and collagen types

IV, V. VII, X. Cleaves the collagen-like sequence Pro-Gin-Gly-|-

CC I-COPACTOR: Binds 4 calcium ions per subunit (By similarity).

CC -- COPACTOR: Binds 2 zinc ions per subunit (By similarity).

CC -- SUBUNIT: Ligand for integrin alpha-V/beta-3.

CC -- SUBUNIT: Ligand for integrin alpha-V/beta-3.

CC -- SUBUNIT: Ligand for integrin alpha-V/beta-3.

CC -- STMILARITY: Belongs to the peptidase MIOA family.

CC -- SIMILARITY: Contains 3 fibronectin type-II domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This Swiss-Prot entry is copyright. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. ABG76309-ABG76321 represent peptide inhibitors of MMPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides peptides and compositions containing such peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          윤
                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproteinase (MMP), where the peptide can inhibit the expression of VEGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidiabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VEGF, and so can be used for inhibiting expression of VEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be careated for innerestatic, vascularised, non-vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions chronic wounds, heart diseases and stroke. (I) is also useful contraction and diabetic retinopathy. The present sequence represents a human MMP cleavage region peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; peptide inhibitor; matrix metalloproteinase-2; MMP-2; cleavage region; procenzyme form; cellular proliferation; fibroblast; keratinocyte; healthy skin development; wound healing; scarring; skin tone; wrinkle; anti-aging; vulnerary.
                                                                                                                                                                                                                                                                                                                            Anti-angiogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular endothelial growth factor and treating cancers and tissue injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel composition for inhibiting growth of chondrosarcoma cells comprising an amount of a peptide and a pharmaceutical carrier. The invention may be useful for the production of compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 2 inhibitors, metalloprotease 3 inhibitors, metalloprotease 6 inhibitors, metalloprotease 7 inhibitors, metalloprotease 8 inhibitors, metalloprotease 9 inhibitors, metalloprotease 9 inhibitors, metalloprotease 11 inhibitors, metalloprotease 12 inhibitors, metalloprotease 13 inhibitors of metalloprotease 12 inhibitors, metalloprotease 13 inhibitors of metalloprotease 12 inhibitors, metalloprotease 13 inhibitors of metalloprotease inhibitors of composition is useful for decreasing and inhibiting the growth of chondrosarcoma cells which in turn inhibits growth of a bone tumor or diminishes a size of a bone tumor, useful for
the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloproteinase (MMP) cleavage region peptide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cell growth; pharmaceutical; cytostatic; metalloprotease 1 inhibitor; metalloprotease 2 inhibitor; metalloprotease 3 inhibitor; metalloprotease 3 inhibitor; metalloprotease 5 inhibitor; metalloprotease 6 inhibitor; metalloprotease 7 inhibitor; metalloprotease 7 inhibitor; metalloprotease 9 inhibitor; metalloprotease 10 inhibitor; metalloprotease 10 inhibitor; metalloprotease 11 inhibitor; metalloprotease 12 inhibitor;
                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human matrix metalloproteinase-2 cleavage region polypeptide SegID12

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for the treatment of a wound comprising the administration of a matrix metalloproteinase (MMP) prodomain peptide (). The invention also encompasses a kit containing the MMP prodomain peptide and instructions for its use. The MMP prodomain peptides promote reepithelialisation, provisional matrix formation and angiogenesis, and may be derived from MMP-1, MMP-2 or MMP-9. They may be used for treating wounds, particularly chronic wounds in burns patients or those with diabetes. The present sequence represents a specifically claimed MMP-2 prodomain peptide of the invention.

The invention describes a novel method of treating and preventing ophthalmological disorders comprising topically administering to the eye a composition delivering a therapeutic agent to the posterior segment of the eye. The composition optionally includes a polymeric suspension agent. The test is used for treating ophthalmic disorders, preferably posterior segment ophthalmic disorders, particularly retinal neovascularisation, mecular codema, ocular insult, ocular manifestation of systemic disease e.g. viral infection, arthritis and rosacea and atrophic disorders of the posterior segment; macular degeneration, disbetic retinopathy retinopathy of prematurity (ROP), glaucoma, centing pigmentosa (RP), posterior uveitis and endophialmitis. The composition may be self administered without using anaesthetics to deliver therapeutically effective amounts of active agent. This peptide sequence is a Martix metalloproteinase (MMP) inhibitory peptide #4, a therapeutic peptide based on the conserved region of MMP pro-collagenase, (see AAU09130), described in the method of the invention
                                        Matrix metalloproteinase; MMP; proenzyme; ophthalmological; retinal neovascularisation; macular degeneration; diabetic retinopathy; retinopathy of prematurity; ROP; retinitis pigmentosa; RP; macular oedema; glocena; posterior uveitis; endophthalmitis; coular insult; arthritis; rosacea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, peptide inhibitor; matrix metalloproteinase-2; MMP-2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                Matrix metalloprotease; inhibitor; tissue damage; angiogenesis; antibody; arthritis; tumour growth; granulomatous inflammatory condition; enzyme; metastasis; sarcoidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This peptide represents a matrix metalloprotease (WMP) inhibitor peptide of the formula: aal-aa2-aa3-aa4-C where aal and aa4 is R or K; aa2 is K, Or N; aa3 is P, A, G, L, I or V; and C is a cysteine having a free sulphydryl group. The peptides can be used to treat trissue damage caused by activated MMPs, e.g. for treating inappropriate angiogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarcoidosis. Antibodies to the peptides can be used to detect the MMPs and can distinguish activated from latent enzyme. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matrix metallo:proteinase peptide(8) - used to inhibit enzyme in treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                              The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. The present sequence represents a peptide tested in a normal human dermal fibroblast (NHDF) migration assay in the examples of the

The present invention relates to novel synthetic oligopeptides effective in blocking cancer invasion and metastasis. The invention relates to matrix metalloprotesinase-2 (MMP-2) peptides. The synthetic oligopeptides are useful as pharmaceutical compositions for blocking or treating cancer invasion and metastases in a human patient. In particular, they are useful for treating brain cancer, lung cancer, skin cancer or breast cancer. The oligopeptides are also useful as vaccines for preventing these cancers, enhancing immune response or raising antibodies for assays used to diagnose diseases involving matrix metalloproteinases or clinical monitoring of the progression or regression of disease. They are also useful in gene therapy. The present sequence is a human MMP-2 peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                 New synthetic oligopeptide, useful for blocking or treating cancer invasion and metastases in a human patient, particularly as a vaccine for treating or preventing diagnosing brain cancer, lung cancer, skin cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fibronectin; healthy skin; wrinkle; wound; vulnerary; dermatological; human; matrix metalloproteinase; MMP.

              The present invention provides peptides and compositions containing such peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloprotesinase (MMP) peptide. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healthy compounds. The present sequence represents a peptide tested in a normal human dermal fibroblast (NHDF) migration assay in the examples of the
                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; peptide inhibitor; matrix metalloproteinase-2; MMP-2; cleavage region; proenzyme form; cellular proliferation; fibroblast; keratinocyte; healthy skin development; wound healing; scarring; skin tone; wrinkle; anti-aging; vulnerary; normal human dermal fibroblast migration assay; NHDF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel peptide inhibitor of proteinase activity of matrix metalloproteinases, e.g. matrix metalloproteinase-2, useful for stimulating cellular proliferation of fibroblasts or keratinocytes.
                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as unlergary and dermatological agents. The present sequence is human matrix metalloproteinase (MMP) peptide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase

The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. ABG76309-ABG76321 represent peptide inhibitors of MMPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fibronectin, healthy skin, wrinkle; wound, vulnerary; dermatological; human; matrix metalloproteinase; MMP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproteinase (WMP), where the peptide can inhibit the expression of VEGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidiabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be used for inhibiting expression of VEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be used for inhibiting injuries including wounds, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disperses and stroke. (I) is also useful macular degeneration and diabetic retinopathy. The present sequence represents a human MMP cleavage region peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This invention relates to a novel composition for inhibiting growth of chondrosarcoma cells comprising an amount of a peptide and a chondrosarcoma cells comprising an amount of a peptide and a production of compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 3 inhibitors, metalloprotease 4 inhibitors, metalloprotease 5 inhibitors, metalloprotease 6 inhibitors, metalloprotease 9 inhibitors, metalloprotease 9 inhibitors, metalloprotease 10 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors, metalloprotease 12 inhibitors, cometalloprotease 12 inhibitors, metalloprotease 13 inhibitors, metalloprotease inhibitors and chondrosarcoma cells which in turn inhibits inhibiting the growth of chondrosarcoma cells which in turn inhibits growth of a bone tumor or diminishes a aize of a bone tumor, useful for treating chondrosarcomas and bone cancers. The present sequence is that if the peptide derived from a human matrix metalloproteinase which may be used during the development of a composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matrix metalloprotease; inhibitor; tissue damage; angiogenesis; antibody; arthritis; tumour growth; granulomatous inflammatory condition; enzyme; metastasis; sarcoidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matrix metallo:proteinase peptide(8) - used to inhibit enzyme in treating tissue damage caused by activated enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This peptide represents a matrix metalloprotease (MMP) inhibitor peptide of the invention. The peptides can be used to treat tissue damage caused
  cells, useful for treating chondrosarcomas and bone cancer, comprises a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides peptides and compositions containing such peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloprotesinase (MMP) cleavage region peptide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                         Composition used for preventing and treating wrinkles and treating wounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A composition for decreasing and inhibiting the growth of chondrosarcoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproteinase (WMP), where the peptide can inhibit the expression of VEGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidiabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be metastatic, non-metastatic, vascularised, non-vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disorders characterised by excessive anglogenesis e.g. macular degeneration and diabetic retinopathy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; matrix metalloproteinase; MMP; anticancer; wound healing; matrix metalloproteinase inhibitor; anticumour; antianglogenic; cardiant; vascular endothelial growth factor inhibitor; VBGF inhibitor; cytostatic; vulnerary; cerebroprotective; antidiabetic; ophthalmological; tumour; defamatological; metaetatic; non-metaetatic; vascularised; heart disease; non-vascularised; surgical incision; chronic wound; stroke; angiogenesis; macular degeneration; diabetic retinopathy; cleavage region.
                                arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarcoidosis. Antibodies to the peptides can be used to detect the MMPs and can distinguish activated from latent enzyme. (Updated on 25-MAR.2003 to correct PR field.) (Updated on 25-MAR.2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti-angiogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular endothelial growth factor and treating cancers and tissue injuries.
activated MMPs, e.g. for treating inappropriate angiogenesis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. The present sequence represents a partial sequence of human
represents a human MMP peptide, which is used in the exemplification of the present invention
                                                                                                                   Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                       peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as whomeray and dematological agents. The present sequence is human matrix metalloprotesinase (WMP) wound site peptide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase

The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have epptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. ABG76309-ABG76321 represent peptide inhibitors of MMPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fibronectin; healthy skin; wrinkle; wound; vulnerary; dermatological; human; matrix metalloproteinase; MMP.
                                                                                                                                                                                                                                                                                              metalloproteinases, e.g. matrix metalloproteinase-2, useful for
stimulating cellular proliferation of fibroblasts or keratinocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human matrix metalloproteinase-2 (MMP2) cleavage region peptide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 54; DB 6; Length 44; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an anti-anglogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloprotesinase (WMP), where the peptide inhibitor of matrix antidiabetic, ophthalmological and dermatological activities. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidiabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be metastatic, non-metastatic, vascularised, non-vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disorders characterised by excessive anglogenesis e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          macular degeneration and diabetic retinopathy. The present sequence represents a human MMP cleavage region peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; peptide inhibitor; matrix metalloproteinase-2; MMP-2; cleavage region; proenzyme form; cellular proliferation; fibroblast; keratinocyte; healthy skin development; wound healing; scarring; skin tone; wrinkle; anti-aging; vulnerary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-angiogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular endothelial growth factor and treating cancers and tissue injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

genome-derived single exon nucleic acid probes useful for analyzing
metalloprotease 10 inhibitors, metalloprotease 11 inhibitors, metalloprotease 12 inhibitors, metalloprotease 13 inhibitors or metalloprotease 12 inhibitors. The composition is useful for decreasing and inhibiting the growth of chondrosarcoma cells which in turn inhibits growth of a bone tumor or diminishes a size of a bone tumor, useful for treating chondrosarcomas and bone cancers. The present sequence is that of a peptide derived from a human matrix metalloproteinase which may be used during the development of a composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        encoded by one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to single exon nucleic acid probes (SENP: see AA11315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide #4866 encoded by probe for measuring placental gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                   The present invention provides peptides and compositions containing such peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloproceainase (MMP) cleavage region peptide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel composition for inhibiting growth of chodrosarcoma cells comprising an amount of a peptide and a pharmaceutical carrier. The invention may be useful for the production of compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 2 inhibitors, metalloprotease 3 inhibitors, metalloprotease 4 inhibitors, metalloprotease 7 inhibitors, metalloprotease 8 inhibitors, metalloprotease 8 inhibitors, metalloprotease 9 inhibitors,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cell growth; pharmaceutical; cytostatic; metalloprotease 1 inhibitor; metalloprotease 2 inhibitor; metalloprotease 3 inhibitor; metalloprotease 3 inhibitor; metalloprotease 5 inhibitor; metalloprotease 6 inhibitor; metalloprotease 7 inhibitor; metalloprotease 8 inhibitor; metalloprotease 9 inhibitor; metalloprotease 10 inhibitor; metalloprotease 11 inhibitor; metalloprotease 12 inhibitor; metalloprotease 11 inhibitor; metalloprotease 12 inhibitor; metalloprotease 13 inhibitor; metalloprotease 14 inhibitor; metalloprotease 15 inhibitor; metalloprotease 15 inhibitor; metalloprotease 17 inhibitor; metalloprotease 18 inhibitor; metalloprotease 19 inhibitor; metalloprotease 10 inhibitor; meta

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21355-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/published_pct_sequences
                                                                                                                                                                                             Protein #4665 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                           Human; gene expression; heart; microarray; vascular system; cardiovascular disease; hypertension; cardiac arrhythmia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 54; DB 4; Length 75; 100.0%; Pred. ```
The invention relates to a spatiality-addressation in a sample derived from human lung comprising single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid sequences mentioned in the specification, or their complements or the 1239 open reading frames derived from the 12614 complements or the 1239 open reading frames derived from the 12614 complements or the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a call expressed in the human lung; measuring gene expression in a sample derived from human lung comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic lung mRNM, to a single exon probe, algorithmically predicting specific hybridisation of detectably clabeled nucleic acids from enkaryote lung mRNM, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon in several comprising one comprising (b) measuring the expression of each of the exons in the tissues and/or cell types using hybridisation to a single exon and corresponding a probe with the exon from genomic sequence by the microarrays having a probe with the exons should be assigned to a single gene, comprising one corresponding beautifying exons in a gene, particularly using human correct probes/open reading frames (ORF). The probes are used for gene expression lung derived mRNM and for the study of lung diseases such as asthma, lung cancer, chronic observative pulmonary fibresis, neurofibromatosis, disease (ILD), familial idiopathic pulmonary fibresis, neurofibromatosis,
                                                                                                            Human peptide encoded by genome-derived single exon probe SEQ ID 29811.
                                                                                                                                       Human; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; asrcoidosis; pulmonary haemosiderosis; pulmonary haticoytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension; hyaline membrane disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to a spatially-addressable set of single exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Spatially-addressable set of single exon nucleic acid probes, used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               measure gene expression in human lung samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 27; SEQ ID NO 29811; 634pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a fragment of a human type IV matrix metalloprocease (MMP) zymogen (precursor protein). The invention relates to MMP inhibitor peptides which can be used to treat tissue damage caused by activated MMPs, e.g. for treating inappropriate angiogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarcoidosis. Antibodies to the peptides can be used to detect the MMPs and can distinguish activated from latent enzyme. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    - used to inhibit enzyme in treating
            Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphagioleicomyonicosis, pulmonary alveolar proteinosis, karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present sequence represents amino acids 30-109 (the propeptide) of human, rat and mouse MMP-2 (EC 3.4.24.24). The three sequences are 100% identical. The specification describes a method of inhibiting tumour growth, inhibiting angiogenesis or inhibiting extracellular matrix destruction, comprising the administration of a polypeptide. The polypeptide amy be a matrix metalloproteinase (MMP-2) propeptide or an MMP-2 is also known as gelatinase A. The invention has cytostatic, antidiabetic, antiheumatic, ophthalmological, antiarthritic, antipsoriatic, ostoopathic, ophthalmological, antiarthritic, antipsoriatic, ostoopathic, on treating cancer and other conditions characterised by excessive neovascularisation, e.g. diabetic retinopathy, rheumatoid arthritis, ageneration and psoriasis; also diseases or disorders involving extracellular matrix destruction, e.g. osteoarthritis, periodontal disease and atherosclerosis. The polypeptides may be administered in combination with conventional anticancer treatments, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present sequence is that of a recombinant human MMP-2 propeptide with a N-terminal polyhistidine tag (EC 3.4.24.24). The propeptide is encoded by the nucleotide sequence given in AAI64189. The specification describes a method of inhibiting tumour growth, inhibiting anglogenesis or inhibiting extracellular matrix destruction, comprising the administration of a polypeptide. The polypeptide may be a matrix metalloproteinase (MMP-2) propeptide or an MMP-2 propeptide-like of polypeptide. MMP-2 propeptide or an MMP-2 propeptide-like or polypeptide. MMP-2 is also known as gelatinase A. The invention has cytostatic, antidiabetic, antirheumatic, ophthalmological, antiarthritic, antisheometric, antisheometric, ophthalmological, antiarthritic, antisheometric contemporate of a second for treating cancer and other conditions characterised by excessive neovascularisation, e.g. diabetic retinopathy, rheumatoid arthritis, age-related macular degeneration and psortasis; cheumatoid arthritis, age-related macular degeneration and psortasis; also diseases or disorders involving extracellular matrix destruction, e.g. osteoarthritis, periodontal disease and atherosclerosis. The polypeptides may be administered in combination with conventional anticancer treatments, e.g. surgery, radiation or chemotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
Use of a polypeptide for inhibiting tumor growth, inhibiting angiogenesis and inhibiting extracellular matrix destruction, and treating e.g. cancer and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

WPI; 2005-417730/42. N-PSDB; AEA19507 polynucleotide encoding a polypeptide with biological activity, ful for treating a disease or disorder, e.g. osteoarthritis, burns, and peripheral disease, stroke, autoimmune disorders, viral infection, or cancer.

Claim 20; SEQ ID NO 768; 500pp; English.

The invention describes a new isolated polymucleotide (I) encoding a polypeptide with biological activity comprising: a nucleotide sequence of sequence of SEQ ID NOS: 1-567 (fully defined); a nucleotide sequence that hybridizes to the sequence of (i) under stringent hybridization conditions; or a nucleotide sequence of (i) under stringent hybridization conditions; or a nucleotide sequence of (i). Also described are: a(n) (expression) vector comprising (I); a host cell genetically engineered to comprise (I) operatively, associated with a regulatory sequence that modulates expression of the polymucleotide in the host cell; an isolated polypeptide comprising a sequence of SEQ ID NOS: 568-1134 (fully defined), where the polypeptide of is: a polypeptide encoded by (I); or a polypeptide encoded by a composition comprising the polypeptide of (3); an ethod of carrier; an antibody directed against the polypeptide of (3); a method of carrier; an antibody directed against the polypeptide of (3); an encoded of producing the polypeptide of (3); and a carrier; an antibody directed against the polypeptide of (3); and a collection of polymucleotides, where the collection comprising of at collection of polymucleotides, where the collection comprising any of the sequences of SEQ ID NOS: 1-567. (I) is a polymucleotide with biological cativity, which comprises any of the amino acid sequence of SEQ ID NOS: 1-567. (I) is a polymucleotide with biological cativity, which comprises any of the amino acid sequence of SEQ ID NOS: 1-567. (I) sequences of data and products dependent on DNA and encode ageneric disorders other traits, in assessing biodiversity, and for producing many other composition and methods are useful for treating a disease or disorder. All sequences of sequences of data and products dependents on DNA and amino acid sequences. The composition and methods are useful for treating a disease, burns, osteoarthritis, periodontal disease, burns, osteoarthritis, periodontal disease, burns, osteoarthritis, periodontal disease, p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a polypeptide (II) with biological activity, which is encoded by an isolated polynucleotide sequence (I) from the present invention. Also described: (I) a vector comprising (I); (2) an expression vector comprising (I); (3) a host cell genetically engineered to comprise (I) which is operatively associated with a regulatory sequence that modulates expression of (I) in the host cell; (4) a polypeptide of (II) encoded by (II); (5) a composition comprising the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4); (7) detecting (I) or the polypeptide of (4) in a sample; (8) identifying a compound that binds to the polypeptide of (4); (9) producing the polypeptide of (4); and (10) a collection of polynucleotides comprising at least one of the polymoclectide sequences (I). The polymucleotides (I) can be used as hybridisation probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                         biological activity; genetic engineering; hybridisation probe; oligomer; primer; chromosome mapping; gene mapping; recombinant protein production;
autoimmune disorders, viral infection, or cancer. This is the amino acid sequence of a novel polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotides, useful as hybridization probes, oligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention relates to human nucleic acid molecules that are specific to lung cells, lung tissue and/or the lung organ. These lung to specific nucleic acide may be naturally occurring conft, genomic DNA, RNA or a fragment, or a non-naturally occurring nucleic acid. Due to alternative splicing and transcriptional modification one lung-specific conference and another acid molecule encoding a protein sequence selected from wisolated nucleic acid molecule encoding a protein sequence selected from 83 (SEQ ID NO: 1-55) sequences, Described is a method of determining the presence of a lung specific nucleic acid or protein in a sample, and a cancer in a partient. Claimed is a vaccine comprising the polypeptide or the nucleic acid encoding the polypeptide. Determining the presence of a lung specific nucleic acid in a sample comprising the presence of a cancer in a partient. Claimed is a vaccine comprising the presence of a lung specific nucleic acid in a sample comprises contacting the sample of with a nucleic acid molecule above which will hybridize to a lung specific nucleic acid in a sample comprises contacting the sample of specific nucleic acid in a bove which will hybridize to a lung specific nucleic acid in a sample comprise of the nucleic acid molecule su immune response against the molecule or the polypeptide is useful for treating a patient with lung cancer, where the administration induces an immune response against the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecule from Homo sapiens, useful for identifying, diagnosing, monitoring, staging, imaging and treating a patient with lung cancer and non-cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                lung cancer cell expressing the nucleic acid molecule or polypeptide. The nucleic acid molecule and polypeptide are also useful for identifying,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diagnosing, monitoring, staging, imaging and treating non-cancerous disease states in lung, identifying lung tissue, monitoring and identifying and/or designing (ant) agonists of the polypeptide, and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene therapy. The present sequence is a human lung specifc protein.
                                                                                                                                                                                                                                                                                                                          DNA hybridization; diagnosis; diagnostic; lung tumor; vaccine; cytostatic; gene therapy; drug screening.
                                                                                                                                                                                                                                                                                    Human lung specifc protein, DEX0486_001.aa.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 12; SEQ ID NO 56; 247pp; English.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creation (PRR) primers, oligomers, and for chromesome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed constant activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders (IN) oplypeptide and polymucleotide sequences have applications in dispurpantions. Greensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and an ocid sequences ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WHDO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

```
The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A polymucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorder, endocrine disorder, neurological disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

```
The original source of the protein material was H-ras transformed human bronchial epithelial cells (TBB-1). The AA sequence was then used to develop oligonuclocide probes which were used to acreen a cDNA library of human skin fibroblast mRNA. The longest clone, pGBL 186.2, represented almost the full gelatinase mRNA sequence except the leader sequence encoding the first few AA's of the signal peptide. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding human type IV collagenase (gelatinase) - for use in the treatment of hypertrophic scars, keloids and intervertebral disc disease.

                                                                                                                                                                                    DNA encoding human type IV collagenase (gelatinase) - for use in the treatment of hypertrophic scars, keloids and intervertebral disc disease.
                                                                                                                                                                                                                        Human type IV collagenase (gelatinase). Protein source was H-ras determined human bronchial epithelial cells (TBE-1). The sequence was determined from clone pGel 186.2 which represents almost the full mRNA sequence. Feature 1 is the N-terminal domain, I; feature 2 is a middle domain, II, which is organised into 3 x 58 amino acid long head to tail repeats (features 4.5, and 6). These show homology to the type II motif collagen binding domain of fibronectin. Feature 3 is the C-terminal domain. The enzyme could be used in the treatment of hypertrophic scars, keloids, and intervertebral disc disease. See also AAN31700. (Updated on 25-MAR-2003 to correct PR field.) Type IV procollagenase was purified from human A2058 melanoma cells. The complete amino acid sequence was determined (see also Hoyhtya, M. et al., (1988) FBES Letters 233, 109-113). Based on this sequence, peptides were synthesised (see features) having homology with a histidine contg. domain at residues 371-386, a cysteine contg. domain at residues 200-370, the 80 at residues amino terminus or a region 159 residues from the carboxy terminus. These regions correspond to the domain of the enzyme involved in enzyme activation and interaction of the enzyme with the substrate. They can be used in the treatment of inappropriate angiogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarciodisis. The peptides can be used to produce antibodies. Peptide 6, at conc. of 0, 1 mm inhibited 80% of the conzect the patent number format of US Government-owned NTIS submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information please visit the Derwent web site at www.derwent.com/dwpi/updates/ntis us.html.) (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                  New type-IV collagenase peptide fragments - used for metallo-proteinase detection and inhibition and for producing antibodies for enzyme
                                                                                                                                                                          Stetlerste W, Krutzsch H;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Fig 1; -pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a human type IV matrix metalloprotease (MMP) zymogen (precursor protein). The invention relates to MMP inhibitor peptides which can be used to treat tissue damage caused by activated MMPs, e.g. for treating inappropriate angiogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarcoidosis. Antibodies to the peptides can be used to detect the MMPs and can distinguish activated from latent enzyme. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PA field.) The present sequence represents the mature protein of human matrix metalloprotease-2 (MMP-2). Fragments of this protein (AAW41228-33) are able to act as alpha-v-beta-5 antagonists Alpha-v-beta-5 is a vitronectin receptor. Inhibitors of alpha-v-beta-5 can inhibit angiogenesis. The specification describes a novel labelled package that contains an inhibitor of angiogenesis i.e. an alpha-v-beta-5 antagonising polypeptide that binds to integrin alpha-v-beta-5 and includes a part of the C-terminal domain of MMP. The antagonists are used to inhibit angiogenesis in inflamed tissue, in solid tumours or metastases, and in wide range of ocular disorders (e.g. diabetic or other forms of retinopathy, neovascular glaucoma, or corneal transplants). They are particularly used to induce regression or to inhibit growth of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The alpha-v-beta-5 antagonists can also be used to treat restenosis caused by migration of smooth muscle cells following angioplasty and to reduce blood supply to selected tissues. The antagonists particularly inhibit neovascularisation where this is induced by cytokines, e.g. transforming growth factor alpha, epidermal growth factor or especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel synthetic oligopeptides effective in blocking cancer invasion and metastasis. The invention relates to matrix metalloproteinase-2 (MMP-2) peptides. The synthetic oligopeptides are useful as pharmaceutical compositions for blocking or treating cancer invasion and metastases in a human patient. In particular, they are useful for treating brain cancer, lung cancer, skin cancer or breast cancer. The oligopeptides are also useful as vaccines for preventing these cancers, enhancing immune response or raising antibodies for assays used to diagnose diseases involving matrix metalloproteinases or clinical monitoring of the progression or regression of disease. They are also useful in gene therapy. The present sequence is the human MMP-2 protein.
                                                                                                                                                                                                                                                                                                 New synthetic oligopeptide, useful for blocking or treating cancer invasion and metastases in a human patient, particularly as a vaccine for treating or preventing diagnosing brain cancer, lung cancer, skin cancer or breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     vitronectin receptor antagonist; neovascularisation; cancer; tumour; inflammation; rheumatoid arthritis; retina; diabetic retinopathy; restenosis; smooth muscle cell migration; angloplaery; antianglogenic; cytostatic; antiinflammatory; antiartheumatic; antitheumatic; ophthalmological; antidiabetic; vasotropic; muscular-gen.; peptidomimetic; matrix metalloprotease 2; MMP-2; gelatinase; human;

The invention relates to a method of inhibiting angiogenesis in a tissue by the administration of a composition comprising an organic peptidomimetic antegonist of integrin alpha-V beta-3 (vitronectin containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumours or solid tumour metastases; to inhibit the growth of solid tumours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation is occurring (e.g., in rheumatoid arthritis); to treat neovascularisation in retinal tissue (e.g., in diabetic retinopathy); to treat restenosis that which occurs following angioplasty); and to reduce the blood supply to a tissue required to support new growth of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Administration of composition comprising organic peptidomimetic alpha-v beta-3 antagonist to e.g. inhibit angiogenesis (inflamed tissue angiogenesis, retinal angiogenesis and tumor angiogenesis) in a tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tissue. The present sequence represents human mature matrix metalloprotease 2 (MMP-2, gelatinase) used in an example of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 54; DB 8; Length 631; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          by the administration of a composition comprising an organic peptidomimetic antagonist of integrin alpha-V beta-3 (vitromectin receptor). The integrin alpha-V beta-3 antagonist and compositions containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumours or solid tumnour metastases; to inhibit the growth of solid tumours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation is occurring (e.g., in rheumatoid arthritis); to treat neovascularisation in retinal tissue (e.g., in diabetic retinopathy); to treat restenosis in a tissue by inhibiting smooth muscle cell migration (such as that which occurs following angioplasty); and to reduce the blood supply to a tissue required to support new growth of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of inhibiting angiogenesis in a tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Administration of composition comprising organic peptidomimetic alpha-v beta-3 antagonist to e.g. inhibit angiogenesis (inflamed tissue angiogenesis, retinal angiogenesis and tumor angiogenesis) in a tissue.

The present sequence is trat or numban matrix metalopycoleinaer (wherein patin is a present sequence is trat or the present sequence is trat or degrading the extracellular matrix components of the basement membrane. The invention relates to methods for treating pain in a patient of degrading the invention relates to methods for treating pain in a patient by administration of an inhibitor of MMP-2 and MMP-9 (see AAB20491). The administration of an inhibitor of MMP-2 is suffering from a disease or tissue damage (claimed), where the patient is suffering from a disease or disorder selected from stroke, haemorrhage, reperfusion injury, cerebral ischaemia and cerebral infarction (claimed). The method is useful for treating a disease, disorder or nerve tissue damage selected from enhanced or exaggerated sensitivity to acute pain, burn pain, atypical facial pain, neuropathic pain, back pain, complex regional pain syndrome infaction, post-hermotherapy pain, post-operative pain, post-stroke pain, post-chemotherapy pain, post-operative pain, post-stroke pain, physiological pain, inflammatory pain, acute inflammatory traumatic nerve injury, and tolerance to narcotics or withdrawal from narcotics (claimed). MMP-2 polypeptides can also be used to screen for agonist or antagonist (inhibitor) compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptide for the treatment of pain and the reduction of tissue damage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of human matrix metalloproteinase-2 (MMP-2)

The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a protease. The inhibitor agent inhibitor agent, i.e. a protease. The inhibitor agent inhibites the action of at least one specific adverse protein, i.e. a protease, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (PDGF), fibroblast growth factor (FGF), connective tissue derived growth factor (FGF), connective dgrowth factor (KGF), transforming growth factor (FGF), opidermal growth factor (FGF), opidermal growth factor (FGF), ascular endothenlail growth factor (FGF), and chrysalin. Inhibitors which are included in the composition of the invention include inhibitors of urokinase-type plasminogen activator the treatment of chronic damaged tissue, i.e. wounds and dermal ulcers. The present sequence represents a human MMP-2, and is used to produce the composition of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, matrix metalloproteinase; MMP-2; hair growth; antisense therapy; endopeptidase; skin cell; breast cancer; hair follicle; chromosome 11q22.
                                                                                                                                                                               Composition for the treatment of damaged tissue i.e. chronic wounds and dermal ulcers comprises an inhibitor agent i.e. a protease and a growth

                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                            chromosome 1922. Matrix metalloproceinases are a family of zinc dependent endopeptidases that function extracellularly to degrade proteins typically found in the extracellular matrix. MMP-25 is expressed in skin cells of mammals, particularly in breast cells and hair fellicles. MMP-25 DNA is useful for identifying a nucleic acid molecule encoding all or part of MMP by hybridising MMP-25 to a nucleic acid sample and identifying a sequence that hybridises in the nucleic acid sample. The identification step involves performing polymerase chain reaction (PCR) to amplify the hybridiasing sequence. MMP-25 antibody is useful for identifying type 25 MMP. MMP-25 protein inhibitors may be used to modulate hair growth and breast cancer in a mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; matrix metalloproteinase-2; MMP-2; enzyme; thrombolytic; anticoagulant; cardiant; antiarteriosclerotic; cytostatic; osteopathic; antiinflammatory; antibacterial; virucide; fungicide; antipsoriatic; vulnerary; cerebroprotective; antianginal; ophthalmological; antiartherumatic; antiarthritic; antiulcer; vasotropic; nephrotropic; alpha-v-beta-3 integrin receptor; thrombosis; tumour; osteoporosis; infection; veterinary medicine; rheumatoid arthritis; Crohn's disease;

The invention relates to peptides (ABB79414-ABB79426) derived from the C-
terminal fragment PEX of matrix metalloprotease-2 (MMP-2). Matrix MMP-2
C derivatives of formula X-Y-Z (I) and their salts and solvates are
described. X = H, 1-10C alkanoyl or peptide fragment consisting of 1-20
c described. X = H, 1-10C alkanoyl or peptide fragment consisting of 1-20
c maturally occurring amino acid residues; Y = peptide fragment selected
c from the sequence region 466-660 of human Pro-MMP-2; and Z = OH, NH 2, NH
c -1-10C alkyl NG-10C alkyl)_Z or peptide fragment consisting of 1-20
c naturally occurring amino acid residues. Primary amino groups are
c optionally protected conventionally. The peptides and MMP-2 derivatives
c optionally pathological processes involving interaction of ligands
c (specifically MMP-2) with the alpha-v-beta-3 integrin receptor,
especially pathological processes supported or propagated by
angiogenesis, thrombosis, cardiac infarction, coronary heart disease,
c angiogenesis, thrombosis, cardiac infarction, coronary heart disease,
c arteriosclerosis, tumours, osteoporosis, fibrosis, inflammation,
infections, psoriasis or wound healing deficiency. More generally the
peptides and MMP-2 derivatives are useful in human and veterinary
medicione for the treatment and/or prophylaxis of thrombosis, myocardial
infarction, apoplexy, angina pectoris, tumour diseases, osteolytic
c diseases (e.g. osteoporosis or hypercalcaemia), pathological angiogenic
c diseases (e.g. inflammation), ophthalmological diseases (e.g. diabetic
c rubectic glaucoma), rhematoin arthritis, ulcerative
c colitis, Crohm's disease, atherosclerosis, psoriasis, restenosis after
c angioplasty, viral, bacterial or fungal infections, acute renal failure
c or wound healing deficiency; as antimicrobial/antiseptic agents in
c operations involving biomaterials, implants, catherese or cardiac
c pacemakers); or as diagnostic agents or reagents. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                            New matrix metalloprotease-2 derivative peptides, are alpha-v-beta-3 integrin receptor inhibitors useful e.g. for treating thrombosis, cardiac infarction, tumors, osteoporosis, inflammation or infections.

The present invention relates to a method for diagnosing breast cancer in a subject suspected of having endometrial cancer. The method comprises in an endometrial sample suspected of being cancerous. The method comprises the nan endometrial sample suspected of being cancerous. The human genes of the invention are differentially expressed in breast tumours of characterised as high or low MAI (mitotic activity index). These sets of genes can be used to discriminate between high and low MAI breast tumours. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their products. The methods and arrays are useful for the diagnosis and prognosis of endometrial cancer, selecting and monitoring treatment regimes, and identification of compounds useful for the treatment of endometrial cancer. ANUG4311 represent the human proteins of the invention that are differentially expressed in breast cancer tissue
                                                                                                                                               Diagnosing breast cancer comprises determining expression of nucleic acid molecules or expression products that are differentially expressed in normal and malignant tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; endothelial cell; EC; tumour endothelial cell; TEM; NEM; Tumour endothelial marker; normal endothelial marker; PEM; pan-endothelial marker; polycystic kidney disease; psoriasis; diabetic retinopathy; rheumatoid arthritis; tumour angiogenesis; necangiogenesis; immune response; cytostatic; antidiabetic; ophthalmological; antirheumatic; antiarthritic; antipsoriatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a ABB907143, ABB90715. The antibodies which bind to TEM proteins have cytostatic, immunostimulant and antiangiogenic activity. They are useful for inhibiting tumour growth, necangiogenesis in subjects bearing a vascularised tumour, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis and psoriasis. Human, mouse and rat TEM genes and the encoded proteins (ABB9075-ABB92141 and ABB90721-ABB90789) are disclosed, as are marker oligomucleotide sequences: tumour endothelial markers (MEM) ABL91904-ABL92041 and ABL92143-ABL92191; normal endothelial markers (MEM) ABL92042-ABL92044; and pan-endothelial markers (PEM) ABL91995-ABL92044.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; diagnosis of breast cancer; endometrial cancer; breast tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                               An isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumor endothelial marker (TEM) protein, useful for inhibiting tumor growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein MMP2 differentially expressed in breast cancer tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 54; DB 5; Length 660; 100.0%; Pred. New purified human transmembrane protein, designated as tumor endothelial marker (TEM) 3, useful for detecting, diagnosing or treating tumors, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis or
                                                                                                                                                                                                        The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in normal and tumour ECs. Tumour endothelial marker (TEM), normal endothelial marker (NEW), and pun-endothelial marker (PEW) genes are identified in human ECs. The human EC marker proteins and the polynucleotide sequences encoding them are useful for detecting, diagnosing or treating tumours as well as polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis, and psoriasis. They are also useful for inhibiting neoanglogenesis or tumour angiogenesis, for inducing an immune response to tumour endothelial cells in a patient, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          identifying candidate drugs for treating tumours. The present

Anti-anglogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular endothelial growth factor and treating cancers and tissue injuries.

Example 1; Page 43-44; 103pp; English

The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VBGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproteinase (MMP), where the peptide can inhibit the expression of VBGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VBGF, and so can be used for inhibiting expression of VBGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be metastatic, non-metastatic, vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disorders characterised by excessive angiogenesis e.g. macular degeneration and diabetic retinopathy. The present sequence represents the human MMP-2 protein, which is used in the exemplification the present invention

Novel crystalline form of a polypeptide corresponding to the catalytic domain of matrix metalloproteinase 9 protein, useful for selecting or designing chemical modulators which are used for treating diabetes, cancer, arthritis.

Disclosure, Fig 7; 227pp; English.

The invention comprises a crystalline form of a polypeptide corresponding to the catalytic domain of matrix metalloproteinase 9 (MMP9) protein - a gelatinase. The crystalline polypeptide of the invention is useful for treating a metalloproteinase mediated disease or condition in a warm-

The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPs. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. The present sequence represents human MMP-2
blooded animal. The crystalline polypeptide is also useful for determining the three-dimensional structure of the MMP9 catalytic domain to high resolution. The three-dimensional structure of the MMP9 catalytic domain is useful for rational drug design, and the atomic coordinates of the catalytic domain of MMP9 are useful for selecting or designing chemical modulators (preferally inhibitors) of MMP9. The crystalline polypeptide of the invention is useful in the treatment of a metalloproceinase mediated disease or condition, such as: tumour growth; metastasis in cancer; arthritis; osteoarthritis; atherosclerosis;
                                                                                                                                                                                restenosis; periodontitis; multiple sclerosis; glomerulonephritis; graft-versus-host disease; and non-insulin dependent disbetes. The present amino acid sequence represents a human matrix metalloproteinase 2 (MMP2)
                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; peptide inhibitor; matrix metalloproteinase-2; MMP-2; cleavage region; proconzyme form; cellular proliferation; fibroblast; keratinocyte; healthy skin development; wound healing; scarring; skin tone; wrinkle; anti-aging; vulnerary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel peptide inhibitor of proteinase activity of matrix metalloproteinases, e.g. matrix metalloproteinase-2, useful for stimulating cellular proliferation of fibroblasts or keratinocytes.

This invention relates to novel human genes and gene product which are implicated in certain disease states. Compounds which modulate the proteins of the invention may have cytostatic, antiinflammatory, computation of the invention may be useful for gene therapy. The invention cut may be useful for diagnosing or treating a hypoxia-regulated condition, cartythropolesis, or the biological response to hypoxia conditions including processes such as glycolysis, gluconeogenesis, glucose transportation, catecholamine synthesis, iron transport or nitric oxide transportation, catecholamine synthesis, iron transport or nitric oxide synthesis. The disease includes cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, pre-eclampsia, atherosclerosis, inflammatory conditions or wound healing. The present sequence is that of a disease related protein of the invention.

The invention relates to a novel method for diagnosing and analysing autoimmunc disease or arthritides. The method comprises obtaining a patient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that care expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes for targeting in the treatment of rheumatoid arthritis; dentification of genes for targeting in the treatment of rheumatoid arthritis in a mammal array or gene chip, specific for rheumatoid arthritis; screening the array or gene chip, specific for rheumatoid arthritis; screening the efficacy of a candidate drug in vitro for the treatment of collagentinduced arthritis. The compositions of the invention have the following activities: immunosuppressive, antirheumatic, antiathitic, osteopathic, antigout, antiinflammatory, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as freeward of arthritis, gout, juvenile rheumacoid arthritis, and an immenne disease caused by an infectious agent. This sequence represents a protein sequence relating to the genes used in the analysis and treatment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the use of proteases to recruit stem cells from the niches they normally occupy. The invention is useful for recruiting adult stem cells for treating bone marrow failure disorder such as aplastic anaemia and myeloproliferative disorder such as multiple myeloma. The invention is also useful in gene therapy. The present sequence is human matrix metalloproteinase (MMP) protein.
of autoimmune diseases or arthritides. Note: This sequence is not shown in the specification. It has been supplied in an electronic format from
                                                                                                           Gaps

The invention relates to the use of a protease with defined specificity for a target substrate for preparing a medicament for the treatment of a specific disease related to the target substrate. The invention also relates to a pharmaceutical or diagnostic composition comprising one or more enzymes in the use cited, optionally comprising pharmaceutically or diagnostically acceptable carriers, excipients and/or auxiliary agents, on method for cleaving a target substrate in vivo or in vitro comprising contacting the target substrate with a protease as cited in the use contacting the target substrate with a protease as cited in the use a protease with defined specificity for the specific target substrate. The protease with defined specificity for the specific target substrate. The protease with defined specificity for the specific target substrate. The protease with defined specificity for the specific target substrate. The protease bydrolyzes the target substrate and eliminates or reduces one or more biological activities, physico-chemical properties or pharmacological properties of the target protein and/or adds one or more biological activities, physico-chemical protease may be administered to treat immune disorders, inflammatory disorders, pharmacological diseases, dermatological diseases, gastrointestinal diseases, dermatological diseases, inflammatory disorders, diseases, hematological contactine diseases, inflammatory disorders, hematological contactine diseases, inflammatory disorders, hematological contactions and the diseases, inflammatory disorders, hematological contactions and the diseases, and administered to treat immune disorders, inflammatory disorders, hematological contactions and the diseases, dermatological diseases, dermatological diseases, hematological diseases, dermatological diseases, dermatol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diseases, cardiovascular diseases, metabolic disorder, cancers, hematological neurodegenerative diseases, growth disorders, respiratory diseases, genitourinary diseases, gynecological disorders, nutritional disorders and infections. This sequence represents a polypeptide hydrolysed by a protease used in the scope of the invention.
gynecological disorder; nutritional disorder; infection; cytostatic; gastrointestinal-gen.; antiinflammatory; antiasthmatic; analgesic; antiarthritic; osteopathic; antidiabetic; nephrotropic; cardiovascular-gen.; immunosupressive; respiratory-gen.; antipsoriatic; antiallergic; dermatological; enzyme; hydrolysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Proteases with defined specificity for a target substrate useful treating a specific disease related to the target substrate, such cancer, asthma, diabetes, inflammatory disorders and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 54; DB 9; Length 660; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as whorezary and dermatological agents. The present sequence is human matrix metalloproteinase-2 (MMP2) procein. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Protease; immune disorder; inflammation; musculoskeletal disease; dermatological disease; gastrointestinal disease; endocrine disease; metabolic disorder; cancer; hematological disease; cardiovascular disease; cardiovascular disease; neurological disease; growth disorder; respiratory disease; genitourinary disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel composition for inhibiting growth of chondrosarcoma cells comprising an amount of a peptide and a chondrosarcoma cells comprising an amount of a peptide and a chondrosarcoma cells comprising an amount of a peptide and a chondrosarcoma cells comprise. The invention may be useful for the production of compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 5 inhibitors, metalloprotease 5 inhibitors, metalloprotease 6 inhibitors, metalloprotease 7 inhibitors, metalloprotease 10 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors, metalloprotease 12 inhibitors, metalloprotease 13 inhibitors, metalloprotease 13 inhibitors, metalloprotease 13 inhibitors, metalloprotease 13 inhibitors, camposition is useful for decreasing and inhibiting the growth of chondrosarcoma cells which in turn inhibits in thibiting the growth of chondrosarcoma enders. The composition is useful for treating chondrosarcomas and bone cancers. The present sequence is that of a human matrix metalloproteinse which may be used during the composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
                                                                                                                               growth; pharmaceutical; cytostatic; metalloprotease 1 inhibitor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention discloses a composition comprising two or more isolated rat or human polymuclectides or a polymuclectide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the movel polymuclectide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the cativity in an animal of one or more of the polymetides for identifying a compound useful in treating cativity in an animal of one or more of the polymetides given in the specification, a method for identifying a compound useful in treating copylymetides or their antibodies. The polymucleotide or the compound that polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating cativity (CCI) and spared nerve injury (SNI) in an animal (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. spinal segmented nerve injury (SNI)) in an animal (e.g. spinal segmented nerve injury (SNI)) in an animal (e.g. spinal segmented nerve injury (SNI)) in an animal (e.g. spinal segmented nerve injury (SNI)) in an animal (e.g. spinal segmented nerve injury (SNI)) in an animal (e.g. spinal segmented nerve injury (SNI)) in an animal (e.g. spinal segmented nerve injury (SNI)) in an animal spinal segmented nerve injury (SNI) in an enimal spinal segmented in the specification, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, cor human polymucleotides or a polymucleotide which represents a fragment, contained are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially requires the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence the expression of a polymucleotide sequence which is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the polymeleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polymeptides or their antibodies. The polymcleotides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polymeptides or their antibodies. The polymcleotide or the compound that conjury (CUI) and sparaed nerve injury (CNUMG), chronic constriction in units and sparaed nerve injury (CNUMG), chronic constriction the specification) which is differentially expressed during pain. Note: the specification that was other index form in form or mentification, the sequence date for this patent did not form made of the printed and patent did not form pare of the printed or presented is a rat protein did or the printed or presented is a rat protein did the printed or presented is a patent did not form made or did the printed or printed or presented in the protein did not form made or printed or printed or presented is 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ication, but was obtained in electronic form directly from WIPO at

```
Le invention relates to the discovery that angiogenesis is mediated by the specific vitronectin receptor alpha-v beta-3, and that inhibition of alpha-v beta-3, and that inhibition of alpha-v beta-3 include C-terminal tragments (see AAW41083-94) of human or chicken MMP-2. An MMP-2 fragment can be obtained by recombinant DNA methods, such as PCR amplification of the chWMP-2 coding region, cloning into e.g. pGRX-3X, and expression in B. coll as a tusion protein with angiogenesis in inflammed tissue (for treatment of arthritis or rheumatoid arthritis), in solid tumours or metastases (particularly to induce regression or inhibit tumour growth), and in ocular disorders such as diabbetic retinopathy and macular degeneration, as well as to treat restenosis (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

medical conditions. The antagonist may be used to induce the regression of solid tumnours or solid tumnour metastases; to inhibit the growth of solid tumnours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation is occurring (e.g., in rheumatoid arthritis); to treat neovascularisation in retinal tissue (e.g., in diabetic retinopathy); to treat restenosis in a tissue by inhibiting smooth muscle cell migration (such as that which occurs following angioplasty); and to reduce the blood supply to a tissue required to support new growth of the tissue. The present sequence represents chicken matrix metalloprocease 2 (WMP-2, galatinase) used in an example of the invention. Note: The present sequence differs between residues 202-205 compared to the sequence also described as chicken MMP-2 shown in figure 7A-7C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Angiogenesis inhibitor; integrin alpha-V beta-3 antagonist; vurour; vitronectin receptor antagonist; neovascularisation; cancer; tumour; inflammation; rheumatoid arthrits; retina; diabetic retinopathy; restenosis; smooth muscle cell migration; angioplasty; antiangiogenic; cytostatic; antiinflammatory; antiarthritic; antirheumatic; ophthalmological; antidiabatic; vasotropic; muscular-gen.; peptidomimetic; matrix metalloprotease 2; MMP-2; progelatinase; chicken;

The invention relates to a method of inhibiting angiogenesis in a tissue by the administration of a composition comprising an organic by the administration of a composition comprising an organic corresponse antagonist of integrin alpha-V beta-3 (vitronectin receptor). The integrin alpha-V beta-3 antagonist and compositions containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumours or solid tumour metastases, to inhibit the growth of solid tumours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation is occurring (e.g., in rheumatoid arthritis); to treat neovascularisation in a tissue (e.g., in diabetic retinopathy); to treat restenosis in a tissue by inhibiting smooth muscle call migration (such as that which occurs following angioplasty); and to reduce the blood supply to a tissue required to support new growth of the tissue. The present sequence represents chicken matrix metalloprotease 2 (WMP-2, gelatinase) used in an example of the invention. Note: The present sequence differs between residues 202-205 compared to the converse also described as chicken MMP-2 shown in the sequence listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    biological activity; genetic engineering; hybridisation probe; oligomer; primer; chromosome mapping; gene mapping; recombinant protein production; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Administration of composition comprising organic peptidomimetic alpha-v beta-3 antagonist to e.g. inhibit angiogenesis (inflamed tissue angiogenesis, retinal angiogenesis and tumor angiogenesis) in a tissue.
                protein (see SEQ ID NO:25)"
542. ..63
hote= "Corresponds to residues 516-637 of the mature protein (see SEQ ID NO:27)"
575. ..63
hote= "Corresponds to residues 549-637 of the mature protein (see SEQ ID NO:28)"
/note= "Corresponds to residues 445-518 of the mature protein (see SEQ ID NO:25)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
